Chapter 1

libdaisy

Multi-layer hardware abstraction library for Daisy Product family

On STM32H7 MCUs

Lower-levels use STM32 HAL (local copy w/ modifications in Drivers/)

Prefixes and their meanings:

- sys - System level configuration (clocks, dma, etc.)
- per - Peripheral level, internal to MCU (i2c, spi, etc.)
- dev - External device support (external flash chips, DACs, codecs, etc.)
- hid - User level interface elements (encoders, switches, audio, etc.)
- util - library level elements used within the library (not included via [daisy.h](#))
- daisy - core API files (specific boards, platforms have extended user APIs that configure libdaisy more below).

Also included is a core/ folder containing:

- a generic Makefile that can be included in a project Makefile to simplify getting started
- a linker script for defining the sections of memory used by the firmware
- core files for starting the hardware (system_stm32h7xx.c, startup_stm32h750xx.s, etc.)

1.1 Using libdaisy

Due to the amount of hardware configuration and flexibility of the daisy platform, (in the present, and the future), a user can use libdaisy to define their own custom hardware, or include one of our supported board files to jumpstart the creativity, and hack on an existing piece of hardware.

If you are getting started, and have one of the Daisy Family Products, you can skip ahead to that section below.

1.1.1 daisy.h

The base-level include file. This is all you need to include to create your own custom hardware that uses libdaisy.

[daisy_seed.h](#) is an example of a board level file that utilizes libdaisy to define some hardware, and provide flexible access.

1.1.2 daisy_seed.h

The SOM-level include file. This can be used with any boards that use the Daisy Seed hardware.

Additional configuration files, with more specific hardware access are provided below for our supported hardware platforms.

1.1.3 daisy_platform.h

Several other pairs of files exist in the repo for each of the supported hardware platforms that work with Daisy Seed.

These are:

- daisy_field
- daisy_patch
- daisy_petal
- daisy_pod

With these files a number of additional initialization, and configuration is done by the library.

This allows a user to jump right into their new product with a simple api to do things without having a full understanding of what's going on under the hood.

With this flexible approach to the hardware configuration, we hope to promote a lot of fantastic hardware along with code to go with it.

Embedded Audio Engine.

6.3.2 Typedef Documentation

6.3.2.1 `dsy_audio_callback`

```
typedef void(* dsy_audio_callback) (float *, float *, size_t)
```

These are user-defineable callbacks that are called when audio data is ready to be received/transmitted. Function to define for using a single Stereo device for I/O audio is packed as: { LEFT | RIGHT | LEFT | RIGHT }

6.3.2.2 `dsy_audio_mc_callback`

```
typedef void(* dsy_audio_mc_callback) (float **, float **, size_t)
```

Defaults to 4 channels, and is fixed for now.

(still works for stereo, but will still fill buffers)

audio is packed as:

```
{ LEFT | LEFT + 1 | ... | LEFT + SIZE | RIGHT | RIGHT + 1 | ... | RIGHT + SIZE }
```

6.3.3 Enumeration Type Documentation

6.3.3.1 anonymous enum

```
anonymous enum
```

Internally, there are two separate 'audio blocks' that can be configured together or separately

Enumerator

DSY_AUDIO_INTERNAL	&
DSY_AUDIO_EXTERNAL	&
DSY_AUDIO_LAST	&

6.3.4 Function Documentation

6.3.4.1 dsy_audio_enter_bypass()

```
void dsy_audio_enter_bypass (
    uint8_t intext )
```

If the device supports hardware bypass, enter that mode.

6.3.4.2 dsy_audio_exit_bypass()

```
void dsy_audio_exit_bypass (
    uint8_t intext )
```

If the device supports hardware bypass, exit that mode.

6.3.4.3 dsy_audio_init()

```
void dsy_audio_init (
    dsy_audio_handle * handle )
```

i2c_handles can be set to NULL if not needed.

```
void dsy_audio_passthru (
    float * in,
    float * out,

A few useful stereo-interleaved callbacks
Passes the input to the output

6.3.4.5 dsy_audio_set_blocksize()

6.3.4.6 dsy_audio_set_callback()

```
void dsy_audio_set_callback (
    uint8_t intext,
    dsy_audio_callback cb )
```

Sets the user defined, interleaving callback to be called when audio data is ready. `intext` is a specifier for `DSY_AUDIO_INT/EXT` (which audio peripheral to use). When using this, each 'audio block' can have completely independent callbacks.

6.3.4.7 dsy_audio_set_mc_callback()

```
void dsy_audio_set_mc_callback (
    dsy_audio_mc_callback cb )
```

Sets the user defined, non-interleaving callback to be called when audio data is ready. This will always use both `DSY_AUDIO_INT` and `DSY_AUDIO_EXT` blocks together. To ensure clean audio you'll want to make sure the two SAs are set to the same samplerate

6.3.4.8 dsy_audio_silence()

```
void dsy_audio_silence (
    float * in,
    float * out,
    size_t size )
```

sets outputs to 0 without stopping the Audio Engine

6.3.4.9 dsy_audio_start()

```
void dsy_audio_start (
    uint8_t intext )
```

Starts Audio Engine, callbacks will begin getting called. When using with `dsy_audio_mc_callback` (for 4 channels), this function should be called for both audio blocks

6.3.4.10 dsy_audio_stop()

```
void dsy_audio_stop (
    uint8_t intext )
```

Stops transmitting/receiving audio on the specified audio block.

6.13.1 Detailed Description

LED_COLOR_PURPLE	&

LED_COLOR_LAST	&

6.13.3 Function Documentation

6.13.3.1 dsy_led_driver_color_by_name()

```
color* dsy_led_driver_color_by_name (
    uint8_t name )
```

Passing in one of the preset colors will return a pointer to a color struct

Parameters

<i>name</i>	Preset color
-------------	--------------

6.13.3.2 dsy_led_driver_init()

```
void dsy_led_driver_init (
    dsy_i2c_handle * dsy_i2c,
    uint8_t * addr,
    uint8_t addr_cnt )
```

Initializes the LED Driver(s) on the specified I2C Bus

Parameters

<i>*dsy_i2c</i>	should be any dsy_i2c_handle with pins and speed configured.
<i>addr</i>	is either a pointer to 1 device address, or an array of addresses for multiple devices
<i>addr_cnt</i>	is the number of addresses passed in (use '1' for a single device)

6.13.3.3 dsy_led_driver_set_led()

```
void dsy_led_driver_set_led (
    uint8_t idx,
    float bright )
```

sets the LED at the index to the specified brightness (0-1) Index is sequential so device 0 will have idx 0-15, while device 1 will have idx 16-31, etc.

Parameters

<i>idx</i>	Index
<i>bright</i>	Brightness

6.13.3.4 dsy_led_driver_update()

```
void dsy_led_driver_update ( )
```

Updates the LED Driver with the values set using the set function. Currently only updates one driver at a time due to the time it takes to update all of the devices. This can likely be set up to use DMA so that the function doesn't block for so long.

6.15.1 Detailed Description

Daisy devices. Pod, seed, etc.

6.15.2 Macro Definition Documentation

6.15.2.1 DMA_BUFFER_MEM_SECTION

```
#define DMA_BUFFER_MEM_SECTION __attribute__((section(".sram1_bss")))
```

Macro for area of memory that is configured as cacheless This should be used primarily for DMA buffers, and the like.

6.15.2.2 DTCM_MEM_SECTION

```
#define DTCM_MEM_SECTION __attribute__((section(".dtcmram_bss")))
```

THE DTCM RAM section is also non-cached. However, is not suitable for DMA transfers. Performance is on par with internal SRAM w/ cache enabled.

9.1.2.3 `_FS_EXFAT`

```
#define _FS_EXFAT 0
```

This option switches support of exFAT file system. (0:Disable or 1:Enable) / When enable exFAT, also LFN needs to be enabled. (`_USE_LFN >= 1`) / Note that enabling exFAT discards C89 compatibility.

9.1.2.4 `_FS_LOCK`

```
#define _FS_LOCK 2
```

0:Disable or ≥ 1 :Enable The option `_FS_LOCK` switches file lock function to control duplicated file open / and illegal operation to open objects. This option must be 0 when `_FS_READONLY` is 1. // 0: Disable file lock function. To avoid volume corruption, application program / should avoid illegal open, remove and rename to the open objects. / >0 : Enable file lock function. The value defines how many files/sub-directories / can be opened simultaneously under file lock control. Note that the file / lock control is independent of re-entrancy.

9.1.2.5 `_FS_MINIMIZE`

```
#define _FS_MINIMIZE 0
```

0 to 3 This option defines minimization level to remove some basic API functions. // 0: All basic functions are enabled. / 1: `f_stat()`, `f_getfree()`, `f_unlink()`, `f_mkdir()`, `f_truncate()` and `f_rename()` / are removed. / 2: `f_opendir()`, `f_readdir()` and `f_closedir()` are removed in addition to 1. / 3: `f_lseek()` function is removed in addition to 2.

9.1.2.6 `_FS_NOFSINFO`

```
#define _FS_NOFSINFO 0
```

0,1,2 or 3 If you need to know correct free space on the FAT32 volume, set bit 0 of this / option, and `f_getfree()` function at first time after volume mount will force / a full FAT scan. Bit 1 controls the use of last allocated cluster number. // bit0=0: Use free cluster count in the FSINFO if available. / bit0=1: Do not trust free cluster count in the FSINFO. / bit1=0: Use last allocated cluster number in the FSINFO if available. / bit1=1: Do not trust last allocated cluster number in the FSINFO.

9.1.2.7 `_FS_NORTC`

```
#define _FS_NORTC 0
```

&

9.1.2.8 `_FS_READONLY`

```
#define _FS_READONLY 0
```

0:Read/Write or 1:Read only This option switches read-only configuration. (0:Read/Write or 1:Read-only) / Read-only configuration removes writing API functions, `f_write()`, `f_sync()`, `f_unlink()`, `f_mkdir()`, `f_chmod()`, `f_rename()`, `f_truncate()`, `f_getfree()` / and optional writing functions as well.

9.1.2.9 _FS_REENTRANT

```
#define _FS_REENTRANT 0
```

0:Disable or 1:Enable

9.1.2.10 _FS_RPATH

```
#define _FS_RPATH 0
```

0 to 2 This option configures support of relative path. // 0: Disable relative path and remove related functions. / 1: Enable relative path. `f_chdir()` and `f_chdrive()` are available. / 2: `f_getcwd()` function is available in addition to 1.

9.1.2.11 _FS_TIMEOUT

```
#define _FS_TIMEOUT 1000
```

Timeout period in unit of time ticks

9.1.2.12 _FS_TINY

```
#define _FS_TINY 0
```

0:Normal or 1:Tiny This option switches tiny buffer configuration. (0:Normal or 1:Tiny) / At the tiny configuration, size of file object (FIL) is reduced `_MAX_SS` bytes. / Instead of private sector buffer eliminated from the file object, common sector / buffer in the file system object (FATFS) is used for the file data transfer.

9.1.2.13 _LFN_UNICODE

```
#define _LFN_UNICODE 0
```

0:ANSI/OEM or 1:Unicode This option switches character encoding on the API. (0:ANSI/OEM or 1:UTF-16) / To use Unicode string for the path name, enable LFN and set `_LFN_UNICODE = 1`. / This option also affects behavior of string I/O functions.

9.1.2.14 _MAX_LFN

```
#define _MAX_LFN 255
```

Maximum LFN length to handle (12 to 255) The `_USE_LFN` switches the support of long file name (LFN). // 0: Disable support of LFN. `_MAX_LFN` has no effect. / 1: Enable LFN with static working buffer on the BSS. Always NOT thread-safe. / 2: Enable LFN with dynamic working buffer on the STACK. / 3: Enable LFN with dynamic working buffer on the HEAP. // To enable the LFN, Unicode handling functions (`option/unicode.c`) must be added to the project. The working buffer occupies $(_MAX_LFN + 1) * 2$ bytes and / additional 608 bytes at exFAT enabled. `_MAX_LFN` can be in range from 12 to 255. / It should be set 255 to support full featured LFN operations. / When use stack for the working buffer, take care on stack overflow. When use heap / memory for the working buffer, memory management functions, `ff_memalloc()` and `ff_memfree()`, must be added to the project.

9.1.2.15 _MAX_SS

```
#define _MAX_SS 512
```

512, 1024, 2048 or 4096 These options configure the range of sector size to be supported. (512, 1024, / 2048 or 4096) Always set both 512 for most systems, all type of memory cards and / harddisk. But a larger value may be required for on-board flash memory and some / type of optical media. When _MAX_SS is larger than _MIN_SS, FatFs is configured / to variable sector size and GET_SECTOR_SIZE command must be implemented to the / disk_ioctl() function.

9.1.2.16 _MIN_SS

```
#define _MIN_SS 512
```

512, 1024, 2048 or 4096

9.1.2.17 _MULTI_PARTITION

```
#define _MULTI_PARTITION 0
```

0:Single partition, 1:Multiple partition This option switches support of multi-partition on a physical drive. / By default (0), each logical drive number is bound to the same physical drive / number and only an FAT volume found on the physical drive will be mounted. / When multi-partition is enabled (1), each logical drive number can be bound to / arbitrary physical drive and partition listed in the VolToPart[]. Also f_fdisk() / function will be available.

9.1.2.18 _NORTC_MDAY

```
#define _NORTC_MDAY 4
```

&

9.1.2.19 _NORTC_MON

```
#define _NORTC_MON 6
```

&

9.1.2.20 _NORTC_YEAR

```
#define _NORTC_YEAR 2015
```

The option _FS_NORTC switches timestamp function. If the system does not have / any RTC function or valid timestamp is not needed, set _FS_NORTC = 1 to disable / the timestamp function. All objects modified by FatFs will have a fixed timestamp / defined by _NORTC_MON, _NORTC_MDAY and _NORTC_YEAR in local time. / To enable timestamp function (_FS_NORTC = 0), get_fattime() function need to be / added to the project to get current time from real-time clock. _NORTC_MON, / _NORTC_MDAY and _NORTC_YEAR have no effect. / These options have no effect at read-only configuration (_FS_READONLY = 1).

9.1.2.21 _STR_VOLUME_ID

```
#define _STR_VOLUME_ID 0
```

0:Use only 0-9 for drive ID, 1:Use strings for drive ID

9.1.2.22 _STRF_ENCODE

```
#define _STRF_ENCODE 3
```

When `_LFN_UNICODE == 1`, this option selects the character encoding ON THE FILE to / be read/written via string I/O functions, `f_gets()`, `f_putc()`, `f_puts` and `f_printf()`. // 0: ANSI/OEM / 1: UTF-16LE / 2: UTF-16BE / 3: UTF-8 // This option has no effect when `_LFN_UNICODE == 0`.

9.1.2.23 _SYNC_t

```
#define _SYNC_t osSemaphoreId
```

The option `_FS_REENTRANT` switches the re-entrancy (thread safe) of the FatFs / module itself. Note that regardless of this option, file access to different / volume is always re-entrant and volume control functions, `f_mount()`, `f_mkfs()` / and `f_fdisk()` function, are always not re-entrant. Only file/directory access / to the same volume is under control of this function. // 0: Disable re-entrancy. `_FS_TIMEOUT` and `_SYNC_t` have no effect. / 1: Enable re-entrancy. Also user provided synchronization handlers, / `ff_req_grant()`, `ff_rel_grant()`, `ff_del_syncobj()` and `ff_cre_syncobj()` / function, must be added to the project. Samples are available in / `option/syscall.c`. // The `_FS_↵_TIMEOUT` defines timeout period in unit of time tick. / The `_SYNC_t` defines O/S dependent sync object type. e.g. HANDLE, ID, OS_EVENT*, / SemaphoreHandle_t and etc.. A header file for O/S definitions needs to be / included somewhere in the scope of `ff.h`.

9.1.2.24 _USE_CHMOD

```
#define _USE_CHMOD 0
```

This option switches attribute manipulation functions, `f_chmod()` and `f_utime()`. / (0:Disable or 1:Enable) Also `_F_↵S_READONLY` needs to be 0 to enable this option.

9.1.2.25 _USE_EXPAND

```
#define _USE_EXPAND 0
```

This option switches `f_expand` function. (0:Disable or 1:Enable)

9.1.2.26 _USE_FASTSEEK

```
#define _USE_FASTSEEK 1
```

This option switches fast seek feature. (0:Disable or 1:Enable)

9.1.2.27 _USE_FIND

```
#define _USE_FIND 0
```

This option switches filtered directory read functions, `f_findfirst()` and `/ f_findnext()`. (0:Disable, 1:Enable 2:Enable with matching alname[] too)

9.1.2.28 _USE_FORWARD

```
#define _USE_FORWARD 0
```

This option switches `f_forward()` function. (0:Disable or 1:Enable)

9.1.2.29 _USE_LABEL

```
#define _USE_LABEL 0
```

This option switches volume label functions, `f_getlabel()` and `f_setlabel()`. / (0:Disable or 1:Enable)

9.1.2.30 _USE_LFN

```
#define _USE_LFN 1
```

0 to 3

9.1.2.31 _USE_MKFS

```
#define _USE_MKFS 1
```

This option switches `f_mkfs()` function. (0:Disable or 1:Enable)

9.1.2.32 _USE_STRFUNC

```
#define _USE_STRFUNC 2
```

0:Disable or 1-2:Enable This option switches string functions, `f_gets()`, `f_putc()`, `f_puts()` and `/ f_printf()`. // 0: Disable string functions. / 1: Enable without LF-CRLF conversion. / 2: Enable with LF-CRLF conversion.

9.1.2.33 _USE_TRIM

```
#define _USE_TRIM 0
```

This option switches support of ATA-TRIM. (0:Disable or 1:Enable) / To enable Trim function, also `CTRL_TRIM` command should be implemented to the `/ disk_ioctl()` function.

9.1.2.34 `_VOLUME_STRS`

```
#define _VOLUME_STRS
```

Value:

```
"RAM", "NAND", "CF", "SD1", "SD2", "USB1", "USB2", \
"USB3"
```

`_STR_VOLUME_ID` switches string support of volume ID. / When `_STR_VOLUME_ID` is set to 1, also pre-defined strings can be used as drive / number in the path name. `_VOLUME_STRS` defines the drive ID strings for each / logical drives. Number of items must be equal to `_VOLUMES`. Valid characters for / the drive ID strings are: A-Z and 0-9.

9.1.2.35 `_VOLUMES`

```
#define _VOLUMES 1
```

Number of volumes (logical drives) to be used.

9.1.2.36 `ff_free`

```
#define ff_free free
```

define the `ff_malloc` `ff_free` macros as standard malloc free

9.1.2.37 `ff_malloc`

```
#define ff_malloc malloc
```

define the `ff_malloc` `ff_free` macros as standard malloc free
