Chapter 1

libdaisy

Multi-layer hardware abstraction library for Daisy Product family

On STM32H7 MCUs

Lower-levels use STM32 HAL (local copy w/ modifications in Drivers/)

Prefixes and their meanings:

- sys System level configuration (clocks, dma, etc.)
- per Peripheral level, internal to MCU (i2c, spi, etc.)
- · dev External device support (external flash chips, DACs, codecs, etc.)
- hid User level interface elements (encoders, switches, audio, etc.)
- util library level elements used within the library (not included via daisy.h)
- daisy core API files (specific boards, platforms have extended user APIs that configure libdaisy more below).

Also included is a core/ folder containing:

- a generic Makefile that can be included in a project Makefile to simplify getting started
- · a linker script for defining the sections of memory used by the firmware
- core files for starting the hardware (system_stm32h7xx.c, startup_stm32h750xx.s, etc.)

1.1 Using libdaisy

Due to the amount of hardware configuration and flexibility of the daisy platform, (in the present, and the future), a user can use libdaisy to define their own custom hardware, or include one of our supported board files to jumpstart the creativity, and hack on an existing piece of hardware.

If you are getting started, and have one of the Daisy Family Products, you can skip ahead to that section below.

2 libdaisy

1.1.1 daisy.h

The base-level include file. This is all you need to include to create your own custom hardware that uses libdaisy.

daisy_seed.h is an example of a board level file that utilizes libdaisy to define some hardware, and provide flexible access.

1.1.2 daisy_seed.h

The SOM-level include file. This can be used with any boards that use the Daisy Seed hardware.

Additional configuration files, with more specific hardware access are provided below for our supported hardware platforms.

1.1.3 daisy_platform.h

Several other pairs of files exist in the repo for each of the supported hardware platforms that work with Daisy Seed.

These are:

- · daisy_field
- · daisy_patch
- · daisy_petal
- · daisy_pod

With these files a number of additional initialization, and configuration is done by the library.

This allows a user to jump right into their new product with a simple api to do things without having a full understanding of what's going on under the hood.

With this flexible approach to the hardware configuration, we hope to promote a lot of fantastic hardware along with code to go with it.

Parameters

channels	must be 1-8
mux_0	First mux pin
mux_1	Second mux pin
mux_2	Third mux pin
adc_pin	#

6.1.7.2 InitSingle()

6.1 daisy::AdcChannelConfig Struct Reference 35 Initializes a single ADC pin as an ADC.

Parameters

pin	Pin to init.

6.2.14.2 GetFloat()

Get floating point from single channel

Parameters

```
chn Channel to get from
```

Returns

Floating point converted value

6.2.14.3 GetMux()

Getters for multiplexed inputs on a single channel (up to 8 per ADC input).

Parameters

chn	Channel to get from
idx	#

Returns

data

6.2.14.4 GetMuxFloat()

Getters for multiplexed inputs on a single channel (up to 8 per ADC input).

Parameters

chn	Channel to get from
idx	#

Returns

Floating point data

6.2.14.5 GetMuxPtr()

Getters for multiplexed inputs on a single channel. (Max 8 per chan)

Parameters

chn	Channel to get from
idx	#

Returns

Pointer to data

6.2.14.6 GetPtr()

Get pointer to a value from a single channel

Parameters

```
chn
```

Returns

Pointer to converted value

6.2.14.7 Init()

Initializes the ADC with the pins passed in.

Parameters

*cfg	an array of AdcChannelConfig of the desired channel
num_channels	number of ADC channels to initialize
ovs	Oversampling amount - Defaults to OVS_32

6.2.14.8 Start()

```
void daisy::AdcHandle::Start ( )
```

Starts reading from the ADC

6.2.14.9 Stop()

```
void daisy::AdcHandle::Stop ( )
```

Stops reading from the ADC

6.3.3 Member Function Documentation

6.3.3.1 Init()

Initializes the control

Parameters

*adcptr	is a pointer to the raw adc read value – This can be acquired with dsy_adc_get_rawptr(), or dsy_adc_get_mux_rawptr()
sr	is the samplerate in Hz that the Process function will be called at.
flip	determines whether the input is flipped (i.e. 1.f - input) or not before being processed.1
invert	determines whether the input is inverted (i.e1.f * input) or note before being processed.
slew_seconds	is the slew time in seconds that it takes for the control to change to a new value.

6.3.3.2 InitBipolarCv()

```
void daisy::AnalogControl::InitBipolarCv (  \mbox{uint16\_t} \ * \ adcptr,   \mbox{float} \ sr \ )
```

This Initializes the AnalogControl for a -5V to 5V inverted input All of the Init details are the same otherwise

Parameters

*adcptr	Pointer to analog digital converter
sr	Audio engine sample rate

6.3.3.3 Process()

```
float daisy::AnalogControl::Process ( )
```

Filters, and transforms a raw ADC read into a normalized range. this should be called at the rate of specified by samplerate at Init time. Default Initializations will return 0.0 -> 1.0 Bi-polar CV inputs will return -1.0 -> 1.0

6.3.3.4 Value()

```
float daisy::AnalogControl::Value ( ) const [inline]
```

Returns the current stored value, without reprocessing

6.12.1 Detailed Description

This is the higher-level interface for the Daisy board.

All basic peripheral configuration/initialization is setup here.

6.12.2 Member Function Documentation

6.12.2.1 AudioSampleRate()

```
float daisy::DaisySeed::AudioSampleRate ( )
```

Returns the audio sample rate in Hz as a floating point number.

6.12.2.2 Configure()

```
void daisy::DaisySeed::Configure ( )
```

Configures the settings for all internal peripherals, but does not initialize them. This allows for modification of the configuration handles prior to initialization.#

6.12.2.3 GetPin()

Returns the gpio_pin corresponding to the index 0-31. For the given GPIO on the Daisy Seed (labeled 1-32 in docs).

6.12.2.4 Init()

```
void daisy::DaisySeed::Init ( )
```

Initializes the Daisy Seed and the following peripherals: SDRAM, QSPI, 24-bit 48kHz Audio via AK4556, Internal USB, as well as the built-in LED and Testpoint.

ADCs, DACs, and other special peripherals (such as I2C, SPI, etc.) can be initialized using their specific initializers within libdaisy for a specific application.

6.12.2.5 SetAudioBlockSize()

Sets the number of samples processed per channel by the audio callback.

6.12.2.6 SetLed()

Sets the state of the built in LED

6.12.2.7 SetTestPoint()

Sets the state of the test point near pin 10

6.12.2.8 StartAudio()

Begins the audio for the seeds builtin audio. the specified callback will get called whenever new data is ready to be prepared.

6.23.2 Member Function Documentation

6.23.2.1 Debounce()

```
void daisy::Encoder::Debounce ( )
```

Called at update_rate to debounce and handle timing for the switch. In order for events not to be missed, its important that the Edge/Pressed checks be made at the same rate as the debounce function is being called.

6.23.2.2 FallingEdge()

```
bool daisy::Encoder::FallingEdge ( ) const [inline]
```

Returns true if the encoder was just released.

6.23.2.3 Increment()

```
int32_t daisy::Encoder::Increment ( ) const [inline]
```

Returns +1 if the encoder was turned clockwise, -1 if it was turned counter-clockwise, or 0 if it was not just turned.

6.23.2.4 Init()

Initializes the encoder with the specified hardware pins. Update rate should be the rate at which Debounce() gets called in Hertz.

6.23.2.5 Pressed()

```
bool daisy::Encoder::Pressed ( ) const [inline]
```

Returns true while the encoder is held down.

6.23.2.6 RisingEdge()

```
bool daisy::Encoder::RisingEdge ( ) const [inline]
```

Returns true if the encoder was just pressed.

6.23.2.7 TimeHeldMs()

```
float daisy::Encoder::TimeHeldMs ( ) const [inline]
```

Returns the time in milliseconds that the encoder has been held down.

March 2020

6.26.2 Member Function Documentation

6.26.2.1 Init()

Initializes an LED using the specified hardware pin.

Parameters

pin	chooses LED pin
invert	will set whether to internally invert the brightness due to hardware config.
samplerate	sets the rate at which 'Update()' will be called (used for software PWM)

6.26.2.2 Set()

```
void daisy::Led::Set (
     float val )
```

Sets the brightness of the Led.

Parameters

val

will be cubed for gamma correction, and then quantized to 8-bit values for Software PWM 8-bit is for more flexible update rate options, as 12-bit or more would require faster update rates.

6.26.2.3 Update()

```
void daisy::Led::Update ( )
```

This processes the pwm of the LED sets the hardware accordingly.

6.28.11.2 Init()

Initializes the MidiHandler

Parameters

in_mode	Input mode
out_mode	Output mode

6.28.11.3 Listen()

```
void daisy::MidiHandler::Listen ( )
```

Start listening

6.28.11.4 Parse()

Feed in bytes to state machine from a queue. Populates internal FIFO queue with MIDI Messages For example with uart: midi.Parse(uart.PopRx());

Parameters

byte #

6.28.11.5 PopEvent()

```
MidiEvent daisy::MidiHandler::PopEvent ( ) [inline]
```

Pops the oldest unhandled MidiEvent from the internal queue

Returns

The event to be handled

6.28.11.6 StartReceive()

```
void daisy::MidiHandler::StartReceive ( )

RESET	Reset pin
NUM_PINS	Num pins

6.30.3 Member Function Documentation

6.30.3.1 DrawPixel()

Sets the pixel at the specified coordinate to be on/off.

Parameters

Х	x Coordinate
У	y coordinate
on	on or off

6.30.3.2 Fill()

```
void daisy::OledDisplay::Fill (
```

```
bool on )
```

Fills the entire display with either on/off.

Parameters

```
on Sets on or off.
```

6.30.3.3 Init()

Takes an argument for the pin cfg

Parameters

pin_cfg | should be a pointer to an array of OledDisplay::NUM_PINS dsy_gpio_pins

6.30.3.4 SetCursor()

Moves the 'Cursor' position used for WriteChar, and WriteStr to the specified coordinate.

Parameters

X	x pos
У	y pos

6.30.3.5 Update()

```
void daisy::OledDisplay::Update ( )
```

Writes the current display buffer to the OLED device using SPI or I2C depending on how the object was initialized.

6.30.3.6 WriteChar()

Writes the character with the specific FontDef to the display buffer at the current Cursor position.

Parameters

ch	character to be written
font	font to be written in
on	on or off

Returns

#

6.30.3.7 WriteString()

Similar to WriteChar, except it will handle an entire String. Wrapping does not happen automatically, so the width of the string must be kept within the dimensions of the screen.

Parameters

str	string to be written
font	font to use
on	on or off

Returns

#

Destructor

6.31.4 Member Function Documentation

6.31.4.1 Init()

initialize a parameter using an hid_ctrl object.

Parameters

input	- object containing the direct link to a hardware control source.
min	- bottom of range. (when input is 0.0)
max	- top of range (when input is 1.0)
curve	- the scaling curve for the input->output transformation.

6.31.4.2 Process()

```
float daisy::Parameter::Process ( )
```

processes the input signal, this should be called at the samplerate of the hid_ctrl passed in.

Returns

a float with the specified transformation applied.

6.31.4.3 Value()

```
float daisy::Parameter::Value ( ) [inline]
```

Returns

the current value from the parameter without processing another sample. this is useful if you need to use the value multiple times, and don't store the output of process in a local variable.

6.32.1 Detailed Description

3x LEDs configured as an RGB for ease of use.

6.32.2 Member Function Documentation

6.32.2.1 Init()

Initializes 3x GPIO Pins as red, green, and blue elements of an RGB LED

Parameters

red	Red element
green	Green element
blue	Blue element
invert	Flips led polarity

6.32.2.2 Set()

Sets each element of the LED with a floating point number 0-1

Parameters

r	Red element	
g	Green element	
b	Blue element	

6.32.2.3 SetColor()

```
void daisy::RgbLed::SetColor ( {\tt Color}\ c\ )
```

Sets the RGB using a Color object.

Parameters

```
c Color object to set.
```

6.32.2.4 Update()

```
void daisy::RgbLed::Update ( )
```

Updates the PWM of the LED based on the current values. Should be called at a regular interval. (i.e. 1kHz/1ms)

enum daisy::Switch::Polarity

Specifies whether the pressed is HIGH or LOW.

Enumerator

POLARITY_NORMAL		
	6.39.3	autotoc_md327
POLARITY_INVERTED		
	6.39.4	autotoc_md328

6.39.4.1 Pull

enum daisy::Switch::Pull

Specifies whether to use built-in Pull Up/Down resistors to hold button at a given state when not engaged.

Enumerator

PULL_UP		
	6.39.5	autotoc_md329
PULL_DOWN		
	6.39.6	autotoc_md330
PULL_NONE		
	6.39.7	autotoc_md331

6.39.7.1 Type

enum daisy::Switch::Type

Specifies the expected behavior of the switch

6.39.10 Member Function Documentation

6.39.10.1 FallingEdge()

```
bool daisy::Switch::FallingEdge ( ) const [inline]
```

Returns

true if the button was just released

Initializes the switch object with a given port/pin combo.

Parameters

pin	port/pin object to tell the switch which hardware pin to use.
update_rate	the rate at which the Debounce() function will be called. (used for timing).
t	switch type – Default: TYPE_MOMENTARY
pol	switch polarity – Default: POLARITY_INVERTED
ри	switch pull up/down - Default: PULL_UP

Simplified Init.

Parameters

pin	port/pin object to tell the switch which hardware pin to use.
update_rate	the rate at which the Debounce() function will be called. (used for timing). Called at update_rate
	to debounce and handle timing for the switch. In order for events not to be missed, its important
	that the Edge/Pressed checks be made at the same rate as the debounce function is being
	called.

6.39.10.4 Pressed()

```
bool daisy::Switch::Pressed ( ) const [inline]
```

Returns

true if the button is held down (or if the toggle is on)

6.39.10.5 RisingEdge()

```
bool daisy::Switch::RisingEdge ( ) const [inline]
```

Returns

true if a button was just pressed.

6.39.10.6 TimeHeldMs()

```
float daisy::Switch::TimeHeldMs ( ) const [inline]
```

Returns

the time in milliseconds that the button has been held (or toggle has been on)

6.40.2 Member Function Documentation

6.40.2.1 CheckError()

```
int daisy::UartHandler::CheckError ( )
```

Returns

the result of HAL_UART_GetError() to the user.

6.40.2.2 FlushRx()

```
int daisy::UartHandler::FlushRx ( )
```

Flushes the Receive Queue

Returns

OK or ERROR

6.40.2.3 Init()

```
void daisy::UartHandler::Init ( )
```

Initializes the UART Peripheral

6.40.2.4 PollReceive()

Reads the amount of bytes in blocking mode with a 10ms timeout.

Parameters

*buff	Buffer to read to
size	Buff size
timeout	How long to timeout for (10ms?)

Returns

Data received

6.40.2.5 PolITx()

Sends an amount of data in blocking mode.

126 Class Documentation

Parameters

*buff	Buffer of data to send
size	Buffer size

Returns

OK or ERROR

```
6.40.2.6 PopRx()
```

```
uint8_t daisy::UartHandler::PopRx ( )
```

Pops the oldest byte from the FIFO.

Returns

Popped byte

6.40.2.7 Readable()

```
size_t daisy::UartHandler::Readable ( )
```

Checks if there are any unread bytes in the FIFO

Returns

1 or 0 ??

6.40.2.8 RxActive()

```
bool daisy::UartHandler::RxActive ( )
```

Returns

whether Rx DMA is listening or not.

6.40.2.9 StartRx()

Starts a DMA Receive callback to fill a buffer of specified size. Data is populated into a FIFO queue, and can be queried with the functions below. Maximum Buffer size is defined above. If a value outside of the maximum is specified, the size will be set to the maximum.

Parameters

Returns

OK or ERROR

FS_BOTH	Both

6.41.4 Member Function Documentation

6.41.4.1 Init()

Initializes the specified peripheral(s) as USB CDC Devices

Parameters

dev	Device to initialize

6.41.4.2 SetReceiveCallback()

```
void daisy::UsbHandle::SetReceiveCallback ( \label{eq:ReceiveCallback} \mbox{ReceiveCallback} \ \ cb \ )
```

sets the callback to be called upon reception of new data

Parameters

cb | Function to serve as callback

6.41.4.3 TransmitExternal()

Transmits a buffer of 'size' bytes from a USB port connected to the external USB Pins of the daisy seed.

Parameters

buff	Buffer to transmit
size	Buffer size

6.41.4.4 TransmitInternal()

Transmits a buffer of 'size' bytes from the on board USB FS port.

Parameters

buff	Buffer to transmit
size	Buffer size

Returns

The number of files loaded by the WavPlayer

6.44.2.5 Init()

```
void daisy::WavPlayer::Init ( )
```

Initializes the WavPlayer, loading up to max_files of wav files from an SD Card.

6.44.2.6 Open()

Opens the file at index sel for reading.

Parameters

```
sel File to open
```

6.44.2.7 Prepare()

```
void daisy::WavPlayer::Prepare ( )
```

Collects buffer for playback when needed.

6.44.2.8 Restart()

```
void daisy::WavPlayer::Restart ( )
```

Resets the playback position to the beginning of the file immediately

6.44.2.9 SetLooping()

Sets whether or not the current file will repeat after completing playback.

Parameters

```
loop To loop or not to loop.
```

6.44.2.10 Stream()

```
int16_t daisy::WavPlayer::Stream ( )
```

7.6 src/daisy_pod.h File Reference

```
#include "daisy_seed.h"
```

Classes

· class daisy::DaisyPod

Class that handles initializing all of the hardware specific to the Daisy Patch Board. Helper funtions are also in place to provide easy access to built-in controls and peripherals.

7.7 src/daisy_seed.h File Reference

```
#include "daisy.h"
```

Classes

· class daisy::DaisySeed

This is the higher-level interface for the Daisy board.
All basic peripheral configuration/initialization is setup here.

7.8 src/dev_codec_ak4556.h File Reference

Driver for the AK4556 Stereo Codec.

```
#include "daisy_core.h"
```

Functions

void codec_ak4556_init (dsy_gpio_pin reset_pin)

7.8.1 Detailed Description

Driver for the AK4556 Stereo Codec.

7.8.2 Function Documentation

```
7.8.2.1 codec_ak4556_init()
```

Resets the AK4556

Parameters

reset_pin should be a dsy_gpio_pin that is connected to the RST pin of the AK4556

7.9 src/dev_codec_pcm3060.h File Reference

Driver for the PCM3060 Codec.

```
#include "per_i2c.h"

7.9.1 Detailed Description

Driver for the PCM3060 Codec.

7.9.2 Function Documentation

```
7.9.2.1 codec_pcm3060_init()
```

Resets the PCM060

Parameters

*hi2c array of pins handling i2c?

7.10 src/dev_codec_wm8731.h File Reference

Driver for the WM8731 Codec.

```

- uint8_t codec_wm8731_enter_bypass (dsy_i2c_handle *hi2c)
- uint8_t codec_wm8731_exit_bypass (dsy_i2c_handle *hi2c)

7.10.1 Detailed Description

Driver for the WM8731 Codec.

7.10.2 Function Documentation

7.10.2.1 codec_wm8731_enter_bypass()

Put codec into bypass mode

Parameters

```
*hi2c pins handling i2c
```

7.10.2.2 codec_wm8731_exit_bypass()

Take codec out of bypass mode

Parameters

```
*hi2c pins handling i2c
```

7.10.2.3 codec_wm8731_init()

```
uint8_t mcu_is_master,
int32_t sample_rate,
uint8_t bitdepth )
```

Resets the WM8731

Parameters

*hi2c	array of pins handling i2c?
mcu_is_master	#
sample_rate	Sample rate to run codec at
bitdepth	Bit depth to run codec at

7.11 src/dev_codec_wm8731_frame.h File Reference

7.14.14 Function Documentation

7.14.14.1 dsy_led_driver_color_by_name()

Passing in one of the preset colors will return a pointer to a color struct

Parameters

name	Preset color
1141110	

7.14.14.2 dsy_led_driver_init()

Initializes the LED Driver(s) on the specified I2C Bus

Parameters

	*dsy_i2c	should be any dsy_i2c_handle with pins and speed configured.		
	addr	is either a pointer to 1 device address, or an array of addresses for multiple devices		
İ	addr_cnt	is the number of addresses passed in (use '1' for a single device)		

7.14.14.3 dsy_led_driver_set_led()

sets the LED at the index to the specified brightness (0-1) Index is sequential so device 0 will have idx 0-15, while device 1 will have idx 16-31, etc.

Parameters

idx	Index	
bright	Brightness	

7.14.14.4 dsy_led_driver_update()

```
void dsy_led_driver_update ( )
```

Updates the LED Driver with the values set using the set function Currently only updates one driver at a time due to the time it takes to update all of the devices. This can likely be set up to use DMA so that the function doesn't block for so long.

#define RAM_AS4C16M16SA_H

SDRAM for 32MB AS4C16M16SA (and 64MB equivalent). Thanks to whoever this awesome person is: http-://main.lv/writeup/stm32f4_sdram_configuration.md The Init function is basically a copy and paste. He has references to timing, etc. RAM is configured at 100MHz (fastest possible on the MCU). To use these the .sdram_data/_bss sections must be configured correctly in the LINKER SCRIPT. using BSS is advised for most things, since the DATA section must also fit in flash in order to be initialized. Data section init not properly set up, as SDRAM is not initialized until after startup code.#

7.19.2 Macro Definition Documentation

7.19.2.1 _ CODE_PAGE

#define _CODE_PAGE 850

This option specifies the OEM code page to be used on the target system. / Incorrect setting of the code page can cause a file open failure. // 1 - ASCII (No extended character. Non-LFN cfg. only) / 437 - U.S. / 720 - Arabic / 737 - Greek / 771 - KBL / 775 - Baltic / 850 - Latin 1 / 852 - Latin 2 / 855 - Cyrillic / 857 - Turkish / 860 - Portuguese / 861 - Icelandic / 862 - Hebrew / 863 - Canadian French / 864 - Arabic / 865 - Nordic / 866 - Russian / 869 - Greek 2 / 932 - Japanese (DBCS) / 936 - Simplified Chinese (DBCS) / 949 - Korean (DBCS) / 950 - Traditional Chinese (DBCS)

7.19.2.3 _FS_EXFAT

#define _FS_EXFAT 0

This option switches support of exFAT file system. (0:Disable or 1:Enable) / When enable exFAT, also LFN needs to be enabled. ($_USE_LFN >= 1$) / Note that enabling exFAT discards C89 compatibility.

7.19.2.4 _FS_LOCK

```
#define _FS_LOCK 2
```

0:Disable or >=1:Enable The option _FS_LOCK switches file lock function to control duplicated file open / and illegal operation to open objects. This option must be 0 when _FS_READONLY / is 1. // 0: Disable file lock function. To avoid volume corruption, application program / should avoid illegal open, remove and rename to the open objects. / >0: Enable file lock function. The value defines how many files/sub-directories / can be opened simultaneously under file lock control. Note that the file / lock control is independent of re-entrancy.

7.19.2.5 _FS_MINIMIZE

```
#define _FS_MINIMIZE 0
```

0 to 3 This option defines minimization level to remove some basic API functions. // 0: All basic functions are enabled. / 1: f_stat(), f_getfree(), f_unlink(), f_mkdir(), f_truncate() and f_rename() / are removed. / 2: f_opendir(), f_readdir() and f_closedir() are removed in addition to 1. / 3: f_lseek() function is removed in addition to 2.

7.19.2.6 _FS_NOFSINFO

```
#define _FS_NOFSINFO 0
```

0,1,2 or 3 If you need to know correct free space on the FAT32 volume, set bit 0 of this / option, and f_getfree() function at first time after volume mount will force / a full FAT scan. Bit 1 controls the use of last allocated cluster number. // bit0=0: Use free cluster count in the FSINFO if available. / bit0=1: Do not trust free cluster count in the FSINFO. / bit1=0: Use last allocated cluster number in the FSINFO if available. / bit1=1: Do not trust last allocated cluster number in the FSINFO.

7.19.2.7 FS_NORTC

#define _FS_NORTC 0

7.19.3 autotoc_md289

7.19.3.1 _FS_READONLY

```
#define _FS_READONLY 0
```

0:Read/Write or 1:Read only This option switches read-only configuration. (0:Read/Write or 1:Read-only) / Read-only configuration removes writing API functions, f_write(), f_sync(), / f_unlink(), f_mkdir(), f_chmod(), f_rename(), f_truncate(), f_getfree() / and optional writing functions as well.

7.19.3.2 _FS_REENTRANT

#define _FS_REENTRANT 0

0:Disable or 1:Enable

7.19.3.3 _FS_RPATH

#define _FS_RPATH 0

0 to 2 This option configures support of relative path. // 0: Disable relative path and remove related functions. / 1: Enable relative path. f_chdir() and f_chdrive() are available. / 2: f_getcwd() function is available in addition to 1.

7.19.3.4 _FS_TIMEOUT

#define _FS_TIMEOUT 1000

Timeout period in unit of time ticks

7.19.3.5 _FS_TINY

#define _FS_TINY 0

0:Normal or 1:Tiny This option switches tiny buffer configuration. (0:Normal or 1:Tiny) / At the tiny configuration, size of file object (FIL) is reduced _MAX_SS bytes. / Instead of private sector buffer eliminated from the file object, common sector / buffer in the file system object (FATFS) is used for the file data transfer.

7.19.3.6 LFN UNICODE

#define _LFN_UNICODE 0

0:ANSI/OEM or 1:Unicode This option switches character encoding on the API. (0:ANSI/OEM or 1:UTF-16) / To use Unicode string for the path name, enable LFN and set $_LFN_UNICODE = 1$. / This option also affects behavior of string I/O functions.

7.19.3.7 _MAX_LFN

#define _MAX_LFN 255

Maximum LFN length to handle (12 to 255) The _USE_LFN switches the support of long file name (LFN). / / 0: Disable support of LFN. _MAX_LFN has no effect. / 1: Enable LFN with static working buffer on the BSS. Always NOT thread-safe. / 2: Enable LFN with dynamic working buffer on the STACK. / 3: Enable LFN with dynamic working buffer on the HEAP. / / To enable the LFN, Unicode handling functions (option/unicode.c) must be added / to the project. The working buffer occupies (_MAX_LFN + 1) * 2 bytes and / additional 608 bytes at exFAT enabled. _MAX_LFN can be in range from 12 to 255. / It should be set 255 to support full featured LFN operations. / When use stack for the working buffer, take care on stack overflow. When use heap / memory for the working buffer, memory management functions, ff_memalloc() and / ff_memfree(), must be added to the project.

7.19.3.8 _MAX_SS

#define _MAX_SS 512

512, 1024, 2048 or 4096 These options configure the range of sector size to be supported. (512, 1024, / 2048 or 4096) Always set both 512 for most systems, all type of memory cards and / harddisk. But a larger value may be required for on-board flash memory and some / type of optical media. When _MAX_SS is larger than _MIN_SS, FatFs is configured / to variable sector size and GET_SECTOR_SIZE command must be implemented to the / disk_ioctl() function.

```
7.19.3.9 _MIN_SS
```

#define _MIN_SS 512

512, 1024, 2048 or 4096

7.19.3.10 _MULTI_PARTITION

```
#define _MULTI_PARTITION 0
```

0:Single partition, 1:Multiple partition This option switches support of multi-partition on a physical drive. / By default (0), each logical drive number is bound to the same physical drive / number and only an FAT volume found on the physical drive will be mounted. / When multi-partition is enabled (1), each logical drive number can be bound to / arbitrary physical drive and partition listed in the VolToPart[]. Also f_fdisk() / function will be available.

7.19.3.11 _NORTC_MDAY

#define _NORTC_MDAY 4

7.19.4 autotoc_md291

7.19.4.1 _NORTC_MON

#define _NORTC_MON 6

7.19.5 autotoc_md290

7.19.5.1 _NORTC_YEAR

#define _NORTC_YEAR 2015

The option _FS_NORTC switches timestamp function. If the system does not have / any RTC function or valid timestamp is not needed, set _FS_NORTC = 1 to disable / the timestamp function. All objects modified by FatFs will have a fixed timestamp / defined by _NORTC_MON, _NORTC_MDAY and _NORTC_YEAR in local time. / To enable timestamp function (_FS_NORTC = 0), get_fattime() function need to be / added to the project to get current time form real-time clock. _NORTC_MON, / _NORTC_MDAY and _NORTC_YEAR have no effect. / These options have no effect at read-only configuration (_FS_READONLY = 1).

7.19.5.2 _STR_VOLUME_ID

#define _STR_VOLUME_ID 0

0:Use only 0-9 for drive ID, 1:Use strings for drive ID

7.19.5.3 _STRF_ENCODE

```
#define _STRF_ENCODE 3
```

When $_$ LFN $_$ UNICODE == 1, this option selects the character encoding ON THE FILE to / be read/written via string I/O functions, f $_$ gets(), f $_$ putc(), f $_$ puts and f $_$ printf(). // 0: ANSI/OEM / 1: UTF-16LE / 2: UTF-16BE / 3: UTF-8 // This option has no effect when $_$ LFN $_$ UNICODE == 0.

7.19.5.4 _SYNC_t

```
#define _SYNC_t osSemaphoreId
```

The option _FS_REENTRANT switches the re-entrancy (thread safe) of the FatFs / module itself. Note that regardless of this option, file access to different / volume is always re-entrant and volume control functions, f_mount(), f_mkfs() / and f_fdisk() function, are always not re-entrant. Only file/directory access / to the same volume is under control of this function. // 0: Disable re-entrancy. _FS_TIMEOUT and _SYNC_t have no effect. / 1: Enable re-entrancy. Also user provided synchronization handlers, / ff_req_grant(), ff_rel_grant(), ff_del_syncobj() and ff_cre_syncobj() / function, must be added to the project. Samples are available in / option/syscall.c. // The _FS _ _TIMEOUT defines timeout period in unit of time tick. / The _SYNC_t defines O/S dependent sync object type. e.g. HANDLE, ID, OS_EVENT*, / SemaphoreHandle_t and etc.. A header file for O/S definitions needs to be / included somewhere in the scope of ff.h.

7.19.5.5 _USE_CHMOD

```
#define _USE_CHMOD 0
```

This option switches attribute manipulation functions, $f_chmod()$ and $f_utime()$. / (0:Disable or 1:Enable) Also $_F \leftarrow S_READONLY$ needs to be 0 to enable this option.

7.19.5.6 _USE_EXPAND

```
#define _USE_EXPAND 0
```

This option switches f_expand function. (0:Disable or 1:Enable)

7.19.5.7 _USE_FASTSEEK

```
#define _USE_FASTSEEK 1
```

This option switches fast seek feature. (0:Disable or 1:Enable)

7.19.5.8 _USE_FIND

```
#define _USE_FIND 0
```

This option switches filtered directory read functions, f_findfirst() and / f_findnext(). (0:Disable, 1:Enable 2:Enable with matching altname[] too)

```
7.19.5.9 _USE_FORWARD
```

```
#define _USE_FORWARD 0
```

This option switches f_forward() function. (0:Disable or 1:Enable)

7.19.5.10 _USE_LABEL

```
#define _USE_LABEL 0
```

This option switches volume label functions, f_getlabel() and f_setlabel(). / (0:Disable or 1:Enable)

7.19.5.11 USE LFN

```
#define _USE_LFN 1
```

0 to 3

7.19.5.12 _USE_MKFS

```
#define _USE_MKFS 1
```

This option switches f_mkfs() function. (0:Disable or 1:Enable)

7.19.5.13 _USE_STRFUNC

```
#define _USE_STRFUNC 2
```

0:Disable or 1-2:Enable This option switches string functions, $f_gets()$, $f_putc()$, $f_putc()$, and $f_printf()$. // 0: Disable string functions. / 1: Enable without LF-CRLF conversion.

7.19.5.14 _USE_TRIM

```
#define _USE_TRIM 0
```

This option switches support of ATA-TRIM. (0:Disable or 1:Enable) / To enable Trim function, also CTRL_TRIM command should be implemented to the / disk_ioctl() function.

7.19.5.15 **VOLUME STRS**

```
#define _VOLUME_STRS "RAM", "NAND", "CF", "SD1", "SD2", "USB1", "USB2", "USB3"
```

_STR_VOLUME_ID switches string support of volume ID. / When _STR_VOLUME_ID is set to 1, also pre-defined strings can be used as drive / number in the path name. _VOLUME_STRS defines the drive ID strings for each / logical drives. Number of items must be equal to _VOLUMES. Valid characters for / the drive ID strings are: A-Z and 0-9.

```
7.19.5.16 _VOLUMES
#define _VOLUMES 1
Number of volumes (logical drives) to be used.
7.19.5.17     ff_free
#define ff_free free
define the ff_malloc ff_free macros as standard malloc free
7.19.5.18     ff_malloc
#define ff_malloc malloc
```

7.20.1 Detailed Description

Audio Driver

Configures Audio Device and provides callback for signal processing. Many of the hard-coded values here will change (increase), and/or be replaced by configurable options

7.20.2 Macro Definition Documentation

7.20.2.1 DSY_AUDIO_BLOCK_SIZE_MAX

```
#define DSY_AUDIO_BLOCK_SIZE_MAX 128
```

Defines for generic maximums While 'Audio Channels Max' is set to 2, this is per-SAI 4x4 Audio I/O is possible using the dsy_audio_mc_callback Hard-coded samplerate is calculated from original clock tree. The new clock tree has less than 0.01% error for all supported sampleratesMax block size

7.20.2.2 DSY_AUDIO_CHANNELS_MAX

#define DSY_AUDIO_CHANNELS_MAX 2

Max number of audio channels

7.20.2.3 DSY_AUDIO_H

#define DSY_AUDIO_H

7.20.3 autotoc_md292

7.20.3.1 DSY_AUDIO_SAMPLE_RATE

```
#define DSY_AUDIO_SAMPLE_RATE 48000.0f
```

Default audio engine rate

7.20.4 Typedef Documentation

7.20.4.1 dsy_audio_mc_callback

```
typedef void(* dsy_audio_mc_callback) (float **, float **, size_t)
```

These are user-defineable callbacks that are called when audio data is ready to be received/transmitted. This function is called at samplerate/blocksize (e.g. 1kHz when Function to define for using a single Stereo device for I/Oaudio is packed as: { LEFT | RIGHT | LEFT | RIGHT } typical example:

```
void AudioCallback(float *in, float *out, size_t size)
{
    for (size_t i = 0; i < size; i+=2)
{
    out[i] = in[i]; // Left
    out[i+1] = in[i+1]; // Right
}</pre>
```

/ typedef void (dsy_audio_callback)(float, float, size_t);

/** Defaults to 4 channels, and is fixed for now. (still works for stereo, but will still fill buffers) */ // /** audio is packed as: */ // /** { LEFT | LEFT + 1 | . . . | LEFT + SIZE | RIGHT | RIGHT + 1 | . . . | RIGHT + SIZE } */ // /** typical example:

```
void AudioCallback(float **in, float **out, size_t size)
{
.//
```

7.20.5 Enumeration Type Documentation

7.20.9 Function Documentation

7.20.9.1 dsy_audio_enter_bypass()

If the device supports hardware bypass, enter that mode.**Only minimally tested with WM8731 codec.**

7.20.9.2 dsy_audio_exit_bypass()

If the device supports hardware bypass, exit that mode.**Only minimally tested with WM8731 codec.**

7.20.9.3 dsy_audio_init()

Initializes the Audio Engine using configurations set to the sai_handlei2c_handles can be set to NULL if not needed.

7.20.9.4 dsy_audio_passthru()

A few useful stereo-interleaved callbacks Passes the input to the output

7.20.9.5 dsy_audio_set_blocksize()

Sets the number of samples (per-channel) to be handled in a single audio frame.

7.20.9.6 dsy_audio_set_callback()

Sets the user defined, interleaving callback to be called when audio data is ready.

intext is a specifier for DSY_AUDIO_INT/EXT (which audio peripheral to use).

When using this, each 'audio block' can have completely independent callbacks.

7.20.9.7 dsy_audio_set_mc_callback()

Sets the user defined, non-interleaving callback to be called when audio data is ready. This will always use both DSY_AUDIO_INT and DSY_AUDIO_EXT blocks together. To ensure clean audio you'll want to make sure the two SAIs are set to the same samplerate

7.20.9.8 dsy_audio_silence()

sets outputs to 0 without stopping the Audio Engine.

7.20.9.9 dsy_audio_start()

Starts Audio Engine, callbacks will begin getting called. When using with dsy_audio_mc_callback (for 4 channels), this function should be called for both audio blocks

7.20.9.10 dsy_audio_stop()

Stops transmitting/receiving audio on the specified audio block.

7.36.18 Function Documentation

```
7.36.18.1 dsy_qspi_deinit()
```

```
int dsy_qspi_deinit ( )
```

Deinitializes the peripheral This should be called before reinitializing QSPI in a different mode.

Returns

```
DSY_MEMORY_OK or DSY_MEMORY_ERROR
```

7.36.18.2 dsy_qspi_erase()

Erases the area specified on the chip. Erasures will happen by 4K, 32K or 64K increments. Smallest erase possible is 4kB at a time. (on IS25LP*)

Parameters

start_adr	Address to begin erasing from
end_adr	Address to stop erasing at

Returns

DSY_MEMORY_OK or DSY_MEMORY_ERROR

7.36.18.3 dsy_qspi_erasesector()

```
int dsy_qspi_erasesector ( \mbox{uint32\_t} \ \ \mbox{\it addr} \ )
```

Erases a single sector of the chip. TODO: Document the size of this function.

Parameters

```
addr Address of sector to erase
```

Returns

DSY_MEMORY_OK or DSY_MEMORY_ERROR

7.36.18.4 dsy_qspi_init()

Initializes QSPI peripheral, and Resets, and prepares memory for access.

Parameters

hqspi should be populated with the mode, device and pin_config before calling this function.

Returns

DSY_MEMORY_OK or DSY_MEMORY_ERROR

7.36.18.5 dsy_qspi_write()

Writes data in buffer to to the QSPI. Starting at address to address+size

Parameters

address	Address to write to
size	Buffer size
buffer	Buffer to write

Returns

```
DSY_MEMORY_OK or DSY_MEMORY_ERROR
```

7.36.18.6 dsy_qspi_writepage()

Writes a single page to to the specified address on the QSPI chip. For IS25LP* page size is 256 bytes.

Parameters

adr	Address to write to
SZ	Buff size
buf	Buffer to write

Returns

```
DSY_MEMORY_OK or DSY_MEMORY_ERROR
```

7.43.1 Detailed Description

Low level System Configuration

7.43.2 Function Documentation

7.43.2.1 dsy_system_delay()

Blocking Delay that uses the SysTick (1ms callback) to wait.

Parameters

```
delay_ms Time to delay in ms
```

7.43.2.2 dsy_system_getnow()

```
uint32_t dsy_system_getnow ( )
```

Returns

a uint32_t value of milliseconds since the SysTick started Note! This is a HAL_GetTick()

7.43.2.3 dsy_system_init()

```
void dsy_system_init ( )
```

Initializes Clock tree, MPU, and internal memories voltage regulators. This function *must* be called at the beginning of any program using libdaisy Higher level daisy_files call this through the DaisySeed object.

7.43.2.4 dsy_system_jumpto()

```
void dsy_system_jumpto ( \mbox{uint32\_t } \mbox{\it add} r \mbox{\ )}
```

Jump to an address within the internal memory

This may not work correctly, and may not be very useful with the single sector of memory on the stm32h750**

Parameters

```
addr Address to jump to
```

7.43.2.5 dsy_system_jumptogspi()

```
void dsy_system_jumptoqspi ( )
```

Jumps to the first address of the external flash chip (0x9000000) If there is no code there, the chip will likely fall through to the while() loop TODO: Documentation/Loader for using external flash coming soon.

7.47.12 Function Documentation

7.47.12.1 BSP_SD_AbortCallback()

These functions can be modified in case the current settings (e.g. DMA stream) need to be changed for specific application needs /n

Abort the callback

7.47.12.2 BSP_SD_Erase()

Erase a section of memory

Parameters

StartAddr	Address to start erasing at
EndAddr	Address to stop erasing at

Returns

card state, ERROR, etc.

7.47.12.3 BSP_SD_GetCardInfo()

Parameters

*CardInfo	Pointer to write card info to
↑ UaiuiiiU	i dilitei to wille cald illio to

Parameters

CardInfo

7.47.13 autotoc_md473

```
7.47.13.1 BSP_SD_GetCardState()
uint8_t BSP_SD_GetCardState (
           void )
Returns
     card state, ERROR, etc.
7.47.13.2 BSP_SD_Init()
uint8_t BSP_SD_Init (
            void )
Returns
     card state, ERROR, etc.
7.47.13.3 BSP_SD_IsDetected()
uint8_t BSP_SD_IsDetected (
            void )
Returns

ReadAddr	Address to read from
NumOfBlocks	Number of blocks to be read
Timeout	Timeout len in ms

Returns

OK ERROR, etc.

7.47.13.6 BSP_SD_ReadBlocks_DMA()

No timeout

Parameters

*pData	#
ReadAddr	Address to read from
NumOfBlocks	Number of blocks to be read

Returns

card state, ERROR, etc.

7.47.13.7 BSP_SD_ReadCpltCallback()

Write complete callback

7.47.13.8 BSP_SD_WriteBlocks()

Parameters

*pData	#
WriteAddr	Address to write to
NumOfBlocks	Number of blocks to be written
Timeout	Timeout len in ms

Returns

card state, ERROR, etc.

7.47.13.9 BSP_SD_WriteBlocks_DMA()

No timeout

Parameters

*pData	#
WriteAddr	Address to write to
NumOfBlocks	Number of blocks to be read

Returns

card state, ERROR, etc.
